Appearance of TVM's

The appearance and hygienic nature of a TVM machines is extremely important. The more hygienic a machine is, the more inclined the general public will be to use it.

ECS Limited has available a range of specialists products able to sanitise the keypad, screen and other surfaces, not only killing germs, but also removing built up dirt and grime that may stop the machine from working properly. Unsightly or offensive graffiti can also be removed from TVM machines with specialist products.

Surface Germs

Germs can survive on many surfaces ranging from those in domestic kitchens and hospitals, to commonly used office equipment such as computer keyboards, telephone and even mobile phones. TVM's are not exempt either; a recent study found 70% of ATM machines keypads swabbed were contaminated with bacteria.

More worryingly, 40% of machines had high numbers of faecal bacteria, including shigella spp, which can cause severe gastroenteritis. Chip & Pin machines can also be contaminated with enteric bacteria. So every time you use an ATM, Chip & Pin or TVM machine you can pick up not only your cash or ticket, but also the many germs surviving on the keypad and slots.

Transferral of Bacteria

It has been shown by numerous scientific studies that our hands play an extremely important role in the spread of bacteria and viruses, not just in hospitals, but in the everyday environment. This can include hepatitis, viruses that cause colds and flu and even antibiotic resistant bacteria, for example MRSA.

Individuals with poor hygiene will transfer germs to a machine surface by not washing their hands properly after doing everyday tasks such as using a washroom, emptying the bin, touching raw meat or changing nappies, all of which can contaminate the hands. Bacteria and viruses are then able to survive in the tiny grooves and cracks on surfaces for long periods of time lying in wait until they can be transferred to a more suitable growth environment, i.e. you!

Electromech ECS Ltd

Germs may than be transferred into your body when, out of habit you touch your mouth or nose. So next time you are using an ATM, chip & Pin or TVM, think twice before eating your sandwich!

The ECS Solution

Regular sanitising and cleaning of TVM machines by ECS and their partners will improve their condition; appearance and most importantly protect the general public.

ECS and their partners even offer an emergency call out service to remove body fluids, such as vomit or blood, which may have been spilt onto a TVM machine rendering it unusable and therefore reducing potential earnings for the TVM provider

If you would like a quotation, we will need to visit the site and discuss and recommended our work methods so a price per machine can be offered per service
